

 **VoIP service**

BBPGlobal is a service that allows subscribers in Australia and New Zealand to make and receive VoIP calls free of charge. It also lets subscribers receive calls from almost all global fixed and mobile telephone networks for free.

The BBPGlobal service provides each subscriber with a unique extension number they can be reached at via the normal telephone (PSTN) network. To receive calls they use a standard headset and microphone on their computer in conjunction with free downloaded software. If the BBPGlobal subscriber is either busy on another call or is not at their computer, then a voicemail/message system is activated. Subscribers can also add standard SIP-based IP hardware, such as ATA, IP phone or gateways to their service.

For someone calling a subscriber from a public phone network, it is as simple as calling one of BBPGlobal's local access numbers in Sydney, Melbourne, Brisbane, Adelaide, Perth or Auckland and then dialling the subscriber's unique extension.

For the caller, the only cost they'll pay will be to the local access number. In most cases this is an untimed local call. More local access locations will be added to the Broadband Phone network in the near future.
